Author information

Abstract

The elicitation of broadly neutralizing antibodies (bNAbs) is likely to be essential for a preventative HIV-1 vaccine, but this has not yet been achieved by immunization. In contrast, some HIV-1-infected individuals naturally mount bNAb responses during chronic infection, suggesting that years of maturation may be required for neutralization breadth. Recent studies have shown that viral diversification precedes the emergence of bNAbs, but the significance of this observation is unknown. Here we delineate the key viral events that drove neutralization breadth within the CAP256-VRC26 family of 33 monoclonal antibodies (mAbs) isolated from a superinfected individual. First, we identified minority viral variants, termed bNAb-initiating envelopes, that were distinct from both of the transmitted/founder (TF) viruses and that efficiently engaged the bNAb precursor. Second, deep sequencing revealed a pool of diverse epitope variants (immunotypes) that were preferentially neutralized by broader members of the antibody lineage. In contrast, a 'dead-end' antibody sublineage unable to neutralize these immunotypes showed limited evolution and failed to develop breadth. Thus, early viral escape at key antibody-virus contact sites selects for antibody sublineages that can tolerate these changes, thereby providing a mechanism for the generation of neutralization breadth within a developing antibody lineage.

5 TRABALHOS ACADÊMICOS E CIENTÍFICOS NOS CURSOS DE GRADUAÇÃO E PÓS-GRADUAÇÃO

Trabalhos científicos ou acadêmicos consistem em escritos que resultam do desenvolvimento de pesquisas realizadas tanto em Curso de Graduação quanto de Pós-graduação.

São vários os tipos de trabalhos acadêmicos e suas denominações e não há consenso sobre os significados dos diversos termos empregados. Por isso, adotamos, neste trabalho, o entendimento que é dado pela ABNT ou, quando inexistente, o mais aceito, tendo por base a literatura sobre o assunto.

Esta obra não contempla todos os tipos de trabalhos acadêmicos ou científicos. O interesse está voltado para aqueles típicos de disciplinas, conclusão de cursos de graduação e pós-graduação, projeto de pesquisa, além de redação e formatação de artigo.

Nos cursos de graduação, os universitários devem ser orientados a progredir gradativamente da simples informação para a autodescoberta do conhecimento e para a criatividade.

Dessa forma, os cursos de graduação caracterizam-se pela integração social dos universitários, não somente pela sua instrumentalização, mas, principalmente, pela formação de uma cultura acadêmica.

BASIC GENETIC MECHANISMS

DNA, Chromosomes, and Genomes

CHAPTER 4

IN THIS CHAPTER

- THE STRUCTURE AND FUNCTION OF DNA
- CHROMOSOMAL DNA AND ITS PACKAGING IN THE CHROMATIN FIBER
- CHROMATIN STRUCTURE AND FUNCTION
- THE GLOBAL STRUCTURE OF CHROMOSOMES

Life depends on the ability of cells to store, retrieve, and translate the genetic instructions required to make and maintain a living organism. This *hereditary information* is passed on from a cell to its daughter cells at cell division, and from one generation of an organism to the next through the organism's reproductive cells. The instructions are stored within every living cell as its genes, the information-containing elements that determine the characteristics of a species as a whole and of the individuals within it.

As soon as genetics emerged as a science at the beginning of the twentieth century, scientists became intrigued by the chemical structure of genes. The information in genes is copied and transmitted from cell to daughter cell millions of times during the life of a multicellular organism, and it survives the process essentially unchanged. What form of molecule could be capable of such accurate and almost unlimited replication and also be able to exert precise control, directing multicellular development as well as the daily life of every cell? What kind of instructions does the genetic information contain? And how can the enormous amount

As the amount of information in biology expands dramatically, it becomes increasingly important for textbooks to distill the vast amount of scientific knowledge into concise principles and enduring concepts. As with previous editions, *Molecular Biology of the Cell*, Sixth Edition accomplishes this goal with

Genetic information is used extensively to reconstruct the evolutionary and demographic history of organisms. Recently, it has been suggested that genetic information from some parasites can complement genetic data from their hosts. This approach relies upon the hypothesis that such parasites share a common history with their host. In some cases, parasites provide an additional source of information because parasite data can better reconstruct the common history. Here, we discuss which parasite traits are important in determining their usefulness for analysing host history. The key is the matching of the traits of the parasite (e.g. effective population size, generation time, mutation rate and level of host specificity) with the timescales (phylogenetic, phylogeographic and demographic) that are relevant to the issues of concern in host history.

Whiteman and Parker [6] partly summarized the theoretical framework for using parasites as proxies for their host evolutionary history. Here, we further explain why parasites have become used as host 'proxies'. We emphasize that such 'proxy' parasites should share the host genealogical history and provide a better resolution of this common history than would the host itself. We argue that the choice of the most relevant parasite varies with the timescale of the analysis (phylogenetic, phylogeographic or demographic; see Glossary) and that parasites could be most useful at the phylogeographic and demographic scales. A better understanding of the evolutionary history of parasites should broaden the range of host evolutionary questions that can be addressed.
